### **ABSTRACT OF DISCLOSURE**

A method for a graphics chip to access data stored in a system memory of a computer device is disclosed. The method includes using a memory controller to set a 5 block capacity value; using the memory controller to divide a plurality of read requests corresponding to a predetermined request sequence into a plurality of request groups, wherein a total amount of data required by read requests grouped in each request group is less than the block capacity value; and using the memory controller to adjust a request sequence corresponding to read requests grouped in each request group for retrieving data 10 stored at different N pages so that a memory device only performs N-1 page switching operations.
